BULL Industriel Manipulator

Manipulators should be used for ergonomic handling within the production lines and they are extremely important in terms of work safety and providing safety work environment for the workers' health. At the same time, they increase the efficiency of production by reducing the time of moving objects from one point to another. The manipulator works with compressed air and thanks to its mechanical arms, they offer the opportunity to carry products at different distances within its radius limit at the same load value. Since its two axes can rotate 360C infinitely, it eliminates the confusion of usage. All axes have brakes and maintain their position when they are not being used and keep its position.

Weight Capacity
350 kg

Maximum Radius
4000 mm

Vertical Lifting
2200 mm

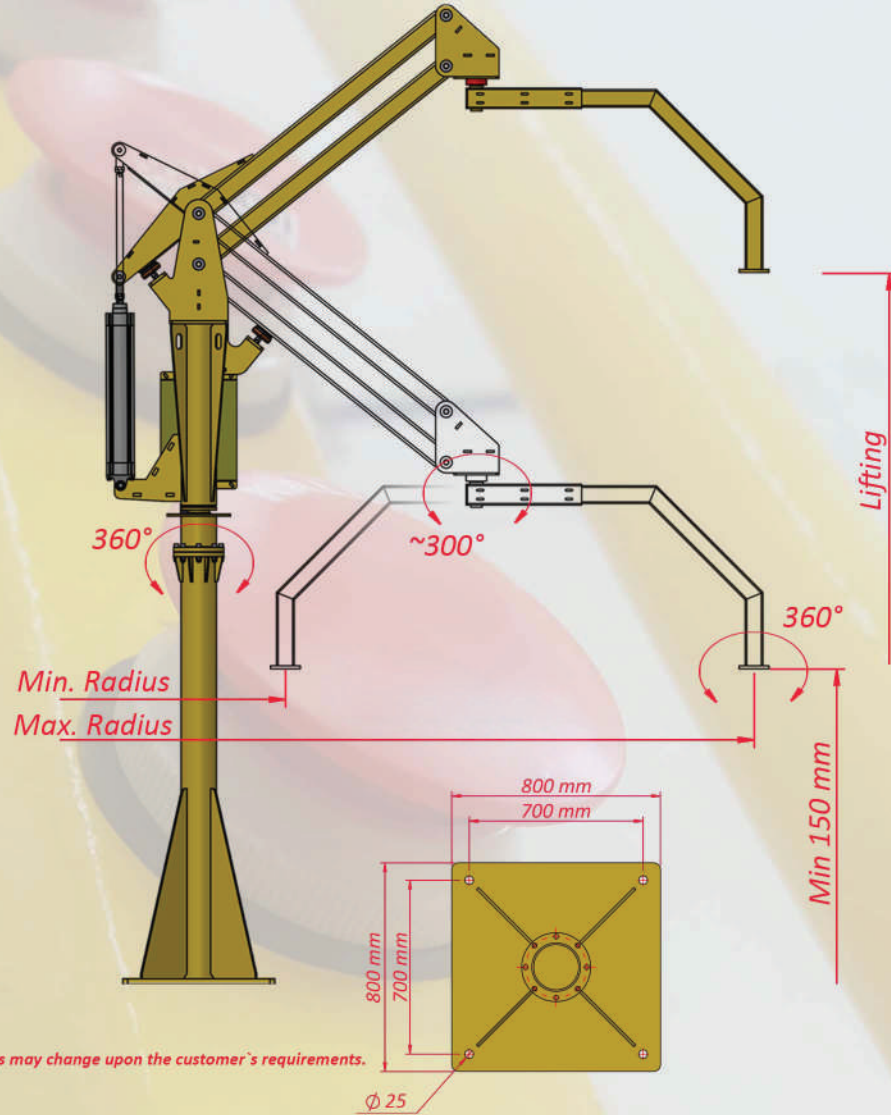

BULL

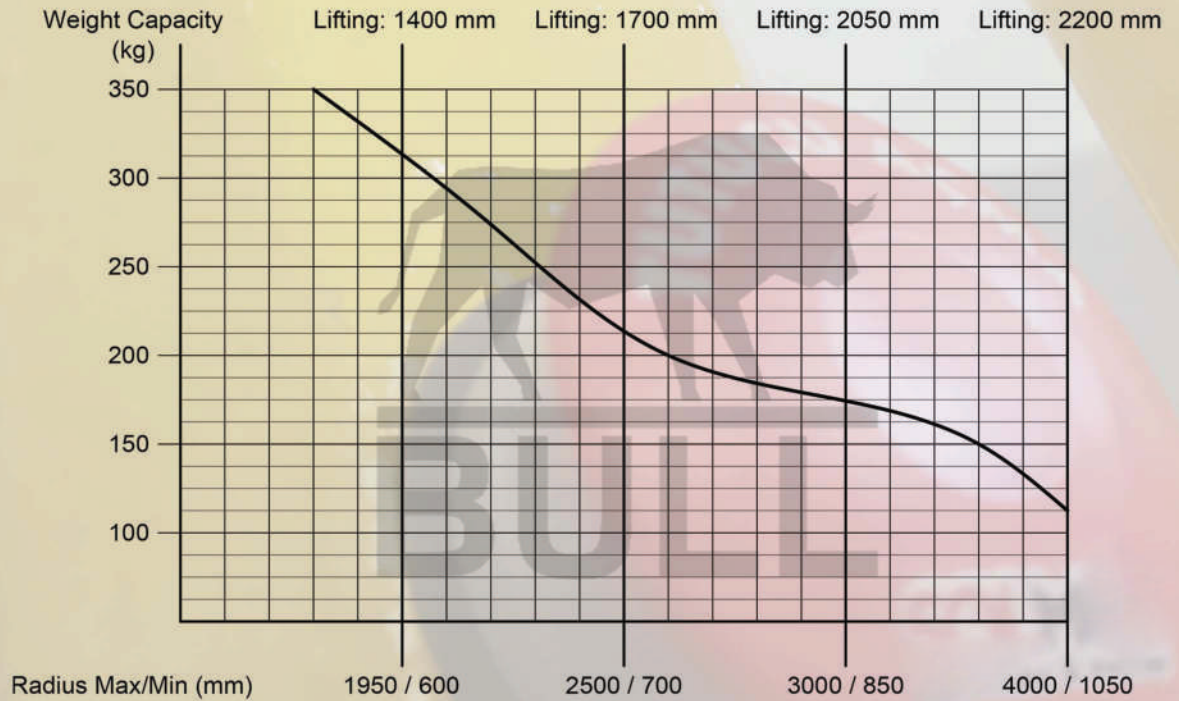

MITMAK

350 kg

Measurements may change upon the customer's requirements.

*Maximum weight is without gripper
